

Meeting Recap

Live Hub Feature Release | 30 min

September 17 2026, 12:28

MIA AI Summary

MEETING INSIGHTS

This session is a recorded feature release walkthrough for Live Hub, presented by Ilan Avner and Tomer Yair Zemel (AudioCodes) as a preview to an upcoming deep-dive webinar. The walkthrough follows the structure of a release announcement email sent to partners approximately one week prior; partners not receiving it were directed to the intercom channel to be added.

The release spans multiple areas: AI-driven call insights, noise cancellation and VAD, STT latency tuning, per-call billing, provider additions, AI agent tooling (Build with AI, MCP server, incomplete turn detection, dynamic call announcements, LLM model selection), prebuilt integrations, and a new REST API. Ilan corrected an early framing during recording: the release covers bot connectivity enhancements and AI agents as parallel areas, not AI agents exclusively.

AudioCodes stated intent to conduct this type of feature release review at every future release. The recorded video will be sent to participants by Tomer Zemel when post-production editing is complete.

AI-Driven Call Insights

A new **Call Insights** tab (distinct from the existing Call Statistics tab) uses a configurable LLM prompt to analyze call transcripts, call context, gathered variables, and call details post-call. Customizable metrics include bot resolution rate, customer sentiment, escalation-to-human rate, and latency. Results populate a dashboard showing bot performance, goal achievement, customer sentiment, and CSAT; non-insight metrics such as latency are also supported. The tab is filterable by bot, SIP connection, or phone number.

Current scope: AI Agents only. **Planned expansion** to third-party bots and human-to-human calls is targeted by end of 2026 ("by the end of this year, or even before").

Noise Cancellation & VAD

Two new capabilities added for all bots: the **Crisp** noise cancellation engine and a new **Celero**-based VAD (Voice Activity Detection). These address static noise and nearby human speech that degrade STT accuracy and interruption detection. Tomer Zemel noted latency is "a huge fight in this department" and these parameters will help identify and resolve issues.

Activation is gated: AudioCodes approval is required before enablement. Partners wishing to trial must contact AudioCodes (email, support ticket, or any channel reaching the team); AudioCodes will activate on their side. This is not described as a blocker — an explicit process is provided — but partners cannot self-activate.

STT Latency Configuration

New per-engine UI controls expose provider-specific latency parameters, including end-of-turn detection settings. Deepgram and Soniox are explicitly mentioned. Defaults are set to best known values; customization is supported and encouraged. Documentation is available and has been updated to improve navigation, including for AI tools parsing the docs.

Per-Call Billing Breakdown

A new itemized billing view per individual call is accessible via call history → three-dot menu → *View Billing Details*, showing cost broken down by bot connection, AI agents, speech services, and recording. Monthly aggregate billing was already available; an aggregate invoice view by AI agent and by service was added approximately one month prior to this release. The feature was driven by multiple customer requests.

Ilan explicitly flagged a discoverability concern: *"how customers will find this I don't know, there are so many three dots."* Neither Ilan nor Tomer had used the feature before the session. No remediation was discussed.

Provider Additions

New providers added in this release: **DeepDub TTS**; additional LLMs for AI Agents. The Google CCAI Agent Studio integration (added a few months prior) was enhanced to support third-party TTS engines for custom bot voices. AudioCodes monitors new providers approximately weekly; keeping Live Hub current with the latest STT, TTS, LLMs, and conversational AI platforms is stated as a primary product goal.

AI Agent Tooling

Build with AI: An embedded natural-language AI assistant in the Agents area allows users to describe desired bot behavior (e.g., "build a bot that books flights with these tools and automatic testing") and have the AI configure it. Currently scoped to AI Agents; planned expansion to full Live Hub by end of 2026.

MCP Server (previously released, highlighted here): Exposes Live Hub configuration and monitoring to external AI platforms such as Claude Code and GPT-based tools. Partners connect their Live Hub account to the MCP server; the external platform can then configure and monitor Live Hub on their behalf. Presented as complementary to the embedded Build with AI feature.

Incomplete Turn Detection: Addresses scenarios where a user pauses mid-utterance (e.g., reciting a digit string), which previously caused a partial transcript to be sent to the LLM prematurely. The LLM now signals that the input is incomplete; the agent withholds its response and waits for the user to finish. Applies beyond digit strings to other incomplete inputs.

Dynamic Call Announcements (during tool execution): Configurable options to fill silence while a tool runs — predefined or LLM-generated contextual messages, typing sounds, or hold music, playable in parallel or sequentially. A success message plays on tool completion; a failure message plays if the tool fails. Designed to eliminate awkward silence in production.

LLM Model Selection UI: The Agent tab now displays cost and intelligence indicators per model. Guidance: higher-reasoning ("thinking") models may increase response latency; model choice should be balanced for use case, cost, and speed. Model can be varied across flows and sub-agents.

Prebuilt Tools & REST API

Additional built-in tools added: send email, web search, weather check, send SMS, Salesforce CRM integration, Monday CRM integration. Presented as a continuously expanding set.

A new **Swagger-documented REST API** exposes all AI Agent configuration, enabling partners to manage AI Agents programmatically from their own platforms.

Action Items

Task	Owner	Timing / Condition
------	-------	--------------------

Send the recorded session to participants when post-production editing is complete.	Tomer Yair Zemel	After editing is done
Activate Crisp noise cancellation and/or Celero VAD for requesting partners on the AudioCodes side.	AudioCodes team	After partner initiates contact

Pending Requests

Partners wishing to trial noise cancellation (Crisp) / Celero VAD — Requested from AudioCodes team via email, support ticket, or any channel. Confirmation pending per-partner; AudioCodes will activate on their side upon contact.

Open Items & Planned Expansions

- **Call Insights — scope expansion:** Extension to third-party bots and human-to-human calls targeted by end of 2026 ("by the end of this year, or even before"); currently AI Agents only.
- **Build with AI — scope expansion:** Extension from AI Agents to full Live Hub configuration targeted by end of 2026.
- **Upcoming deep-dive webinar:** This recording is explicitly a preview; no date stated.
- **Per-call billing discoverability:** Ilan flagged that the feature's location (nested under a three-dot menu in call history) is difficult for customers to find; no remediation was discussed.
- **LLM model latency tradeoff:** Higher-intelligence ("thinking") models may increase response latency; partners are advised to balance model choice against use case, cost, and speed. No resolution mechanism beyond guidance was discussed.
- **Features covered verbally only** (no screen demo in this session): Noise cancellation, Incomplete Turn Detection, Knowledge Base improvements.

Signals

Product Architecture — Live Hub Call Insights & Expansion Roadmap · AudioCodes / Ilan Avner · High confidence

LLM-based Call Insights tab (customizable metrics, post-call transcript analysis) currently scoped to AI Agents; planned expansion to third-party bots and human calls by end of 2026. Build with AI similarly scoped to AI Agents now, full Live Hub by end of 2026.

eng_product_pulse:architecture_decision

Innovation — Dynamic Call Announcements & Incomplete Turn Detection · AudioCodes / Live Hub · High confidence

Dynamic call announcements fill tool-execution silence with predefined or LLM-generated messages, typing sounds, or music, plus success/failure messages. Incomplete turn detection withholds LLM response until user finishes a partial utterance, improving production accuracy.

eng_product_pulse:innovation_idea

Quality Concern — Per-Call Billing Discoverability · Ilan Avner · High confidence

Per-call billing breakdown is nested under a three-dot menu in call history; Ilan explicitly flagged customer discoverability risk. No remediation discussed.

eng_product_pulse:quality_concern · monitoring_gap

Quality Concern — STT Noise & Gated Noise Cancellation · AudioCodes / Live Hub · High confidence

Static noise and nearby speech degrade STT accuracy and interruption detection across all bots. Crisp and Celero VAD added to address this but require AudioCodes approval to activate; partners cannot self-enable.

eng_product_pulse:quality_concern · performance_degradation

Voice of Customer — Per-Call Billing Feature Request Fulfilled · Multiple customers · High confidence

Multiple customers requested itemized per-call billing visibility; feature has been added to call history view in this release.

voc:feature_request · additional_services

Tooling — Full REST API for AI Agent Configuration · AudioCodes / Partners · High confidence

New Swagger-documented REST API exposes all AI Agent configuration, enabling partners to manage AI Agents programmatically from their own platforms.
